

RF Variance Decomposition — How much shadow-probability uncertainty does each physical parameter drive?

Method: first-order variance isolation (Sobol S₁) | N=100 LHS samples | Grid: 115×154 points

$V_k = \text{var}(P \mid \text{param } k \text{ varies, others fixed at median}) \rightarrow A_k = V_k / \sum V_k$ (sums to 100% per grid point)

First-order variance attribution

Error bars = spatial std (variation across grid points)

Scree plot — sorted attribution + cumulative

Analogue of EOF cumulative explained variance
